

BenefitPulse Engine — User Documentation

User Documentation | Standalone PDF edition

Product: BenefitPulse Engine (Card Benefit Activation Prototype) Audience: Card members, product demos, reviewers
Version: 1.0 · July 2026

1. What is BenefitPulse?

BenefitPulse helps you spot unused card protections on recent purchases and move faster toward a claim when coverage exists.

Typical protections the product can surface:

Protection	Everyday meaning
Purchase Protection	Accidental damage or theft of eligible items shortly after purchase
Return Protection	Help when a merchant will not accept a return within a defined window
Travel Delay Insurance	Support for eligible delays on common-carrier travel (meals, lodging, etc.)
Extended Warranty	Possible extension of a short manufacturer warranty

The system also tells you clearly when a charge is outside coverage (for example food delivery or fuel), so you do not chase a claim that policy will not support.

Disclaimer: BenefitPulse is an educational / prototype product. It is not an official American Express service, does not guarantee claim approval, and does not replace issuer policy documents.

2. Who this guide is for

- Card members exploring idle benefits on linked cards
- Demo audiences walking the happy path end to end
- Anyone reviewing the product without reading source code

3. Getting signed in

3.1 Sample account (if your operator seeded data)

Field	Value
Email	demo@amex.com
Password	demo1234

3.2 Create your own account

- 1. Open the app (typically `http://localhost:5173`).
- 2. Choose Create one on the sign-in screen.
- 3. Enter full name, email, and password (min. 6 characters).
- 4. After signup, the system links starter cards (e.g. The Platinum Card® and American Express® Gold Card).

Auth is powered by Supabase Auth. If login fails right after signup, ask your operator to disable email confirmation in Supabase for local demos, or confirm the email first.

4. Workspace map (where things live)

BenefitPulse uses a left taskbar (desktop) and a bottom taskbar (mobile) so each screen stays focused.

Workspace item	What you do there
Overview	Snapshot: claim-eligible count, outside coverage count, linked cards, recent assessments
Coverage	Full coverage ledger of agent outcomes
Charges	Posted transactions; run or re-run coverage assessment
Simulate	Inject a realistic charge and watch the multi-agent pipeline live
Cards	Linked products and reference Amex-style product names
Profile	Account identity (name, email, member ID)
Assistant (chat bubble)	Policy Q&A grounded in knowledge base + optional claim context

Figure: Overview workspace (wireframe).

5. Core concepts (finance-friendly terms)

Term	Meaning in BenefitPulse
Posted charge	A transaction already on your card activity
Coverage assessment	Agents reviewing whether a charge may qualify for a protection
Claim-eligible / Coverage available	Policy rules + confidence support opening a claim packet
Claim ready	A draft claim has been prefilled for you
Outside coverage	Agents concluded the charge is not claim-eligible under current rules
Claim packet	Prefilled claim fields + missing documents checklist
Confidence	How strongly the system believes the match (High / Medium / Low)

6. Happy path (recommended walkthrough)

Step 1 — Overview

1. Sign in.
2. Read the four summary tiles:
 - Claim-eligible - Outside coverage - Linked cards - Potential cover (sum of max coverage on eligible items)
3. Scroll to Recent coverage assessments — mix of eligible and outside-coverage cards.
4. Use the badges to see total counts for both outcomes.

Step 2 — Posted charges

1. Open Charges.
2. Review the coverage column:
 - Green → Coverage available - Grey → Outside coverage - Neutral → Pending review
3. Click Assess coverage (or Re-assess) on any row.
4. Wait for agents; the row and Coverage ledger update automatically.

Wireframes — Charges & Claim Packet

BenefitPulse • Professional Documentation • v0.8

Figure: Posted charges table and claim packet (wireframes).

Step 3 — Coverage ledger

1. Open Coverage.
2. Filter mentally with the badges: claim-eligible vs outside coverage.
3. For eligible items, open Open claim packet.
4. Outside-coverage items show No claim available (by design).

Step 4 — Claim packet

1. Confirm merchant, amount, item description, and estimated claim amount.
2. Note missing documents (e.g. receipt photo, delay certificate).
3. Upload a document when prompted.
4. Add optional notes.
5. Submit the claim when ready.
6. Status moves toward submitted / under review (prototype flow).

Step 5 — Simulate (optional live demo)

1. Open Simulate.
2. Pick a sample scenario (laptop → often eligible; food → outside coverage) or enter a custom merchant/amount.
3. Run Simulate & detect protection.
4. Read pipeline result: eligible flag, confidence, ChromaDB RAG sources, Gemini usage.
5. Return to Overview / Charges to see the saved outcome.

Step 6 — Policy assistant

1. Click the chat bubble.
2. Ask questions such as:

- “Why am I eligible?” - “What documents do I need?” - “What is excluded?”

3. On a claim page, answers can use that claim’s context.

7. Understanding outcomes

7.1 Claim-eligible example

- Merchant: Amazon · MacBook
- Benefit: Purchase Protection
- Confidence: High (e.g. 90%+)
- Action: Open claim packet → attach receipt → submit

7.2 Outside coverage example

- Merchant: Swiggy · food delivery
- Outcome: Outside coverage
- Action: No claim available — dining/consumables are typical exclusions

7.3 Confidence bands

Band	Score	How to read it
High	≥ 85%	Strong match; still verify facts before filing
Medium	60–84%	Plausible; check docs and policy details
Low	< 60%	Borderline (e.g. near window end); treat as manual review

8. Cards screen

- Shows linked products with names styled after public American Express consumer products (e.g. The Platinum Card®, American Express® Gold Card).
- Lists covered benefit categories for educational purposes.
- Reference panel summarizes other well-known Amex product names for demos.

9. Tips for a smooth demo

1. Use the seeded sample account for richest data (high / medium / low confidence + outside coverage).
2. Run Simulate once live so reviewers see Gemini + ChromaDB in action.
3. Always show both eligible and outside-coverage rows — it builds trust.
4. Open the assistant with “What is excluded?” after an outside-coverage charge.
5. Never present BenefitPulse as an official issuer product.

10. Troubleshooting (end user)

Symptom	What to try
Cannot sign in	Check email/password; ask operator about Supabase email confirm
Empty Overview	Seed data may be missing, or no assessments run yet
Assess stuck	Wait for API; check that backend is running
Chat fails	Backend or Gemini key issue — contact operator
Claim button disabled	Item is outside coverage (expected)

11. Privacy & data (user view)

- Account data lives in Supabase (cloud project configured by your operator).
- Receipt uploads are stored for the claim flow (local upload path and/or storage bucket).
- Chat and agents may send merchant/description text to Google Gemini for analysis.
- Do not enter real PAN/full card numbers; the UI only shows last four digits of linked products.

12. Support

For prototype issues, contact the project operator or engineering owner of the BenefitPulse repository. For real card claims, always use official issuer channels.
